AI Automation Dashboard · Simple Workflow & Architecture Guide

1. Plain-English Executive Summary

Ad platforms (like Meta and Google) often **exaggerate** how much sales they make for you. They double-count customers who clicked ads on both platforms, and take credit for sales that would have happened anyway. This is called 'platform bias.'

This system builds a clean, automated marketing command center. It pulls data from **Meta**, **Google**, **Shopify**, and your shipper **Shippo**, cross-checks them, and subtracts returns or cancellations. The result: you see the **actual cash collected** (True Revenue) and get clear, daily guidance on which campaigns to push, pause, or leave alone.

2. How the System Simplifies Your Decisions

A. Finding the Reconciled 'True' Revenue (The Source of Truth)

Instead of trusting ads managers, we take your Shopify sales and subtract customer refunds. Next, we check Shippo to subtract cancelled orders and Cash-on-Delivery (COD) packages that were returned unpaid (Return-to-Origin). What's left is your real business cash flow.

B. Comparing Two Time Windows (1-Day vs. 7-Day Click)

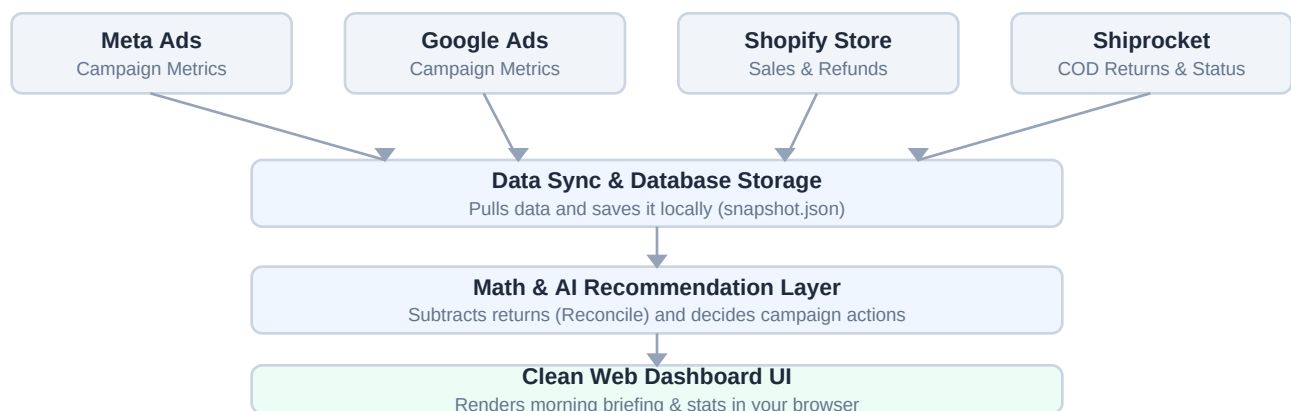

Customers think before they buy, so we compare ads side-by-side in two ways:

- **1-Day Click:** Sales made immediately (within 24 hours). Best for fast, daily performance tweaks.
- **7-Day Click:** Sales made later. Tells you if an ad had a delayed impact on comparing buyers.

C. Daily Morning Briefing (AI Layer)

Every morning, you get a clean summary showing what got better, what got worse, and what is stuck (like out-of-stock SKUs). It gives explicit actions: **Scale** (raise budget for winners), **Cut** (pause losers), or **Hold** (keep running campaigns that convert on a delay).

4. Simple Workflow Breakdown

Stage	Workflow Steps	What it accomplishes for you
1. Sync	System fetches metrics automatically or via the manual 'Refresh' button.	No manual copy-pasting is needed. Everything aligns in real-time.
2. Reconcile	Shopify gross revenue is cross-checked against Shiprocket statuses.	Filters out cancellations and RTOs, showing only actual cash collections.
3. Evaluate	AI checks 1-day vs. 7-day ROAS and flags anomalies.	Prevents premature pausing of slow-converting ads, saving ad yield.
4. Display	Calculated statistics and daily action items render on a dashboard.	Provides a 5-minute plain English summary to start your workday.

5. Live Demo Simulation (No Accounts Needed)

To let you test the dashboard right away, we have pre-configured free keys in your setup (free_demo_key). The system makes real-world web requests to open APIs (Weather and Currency Exchange Rates) to simulate live-wiggling marketing data. Each time you hit 'Refresh', numbers fluctuate dynamically. When you get your actual Meta/Google developer keys, replace the dummy values in the .env file, and the dashboard will instantly transition to display your real business details.

Key Integration Note: Clear, highlighted developer instruction boxes have been added directly inside the connector files (meta.py, google.py, shopify.py, shiprocket.py). They show your tech team exactly how to write the real code bindings when transitioning to live accounts.
